MyVerizon App Sign-in Performance

Asset inventory, HTTP/2 effect and before/after metrics

Proxyman captures on iPhone (iOS 26.6.1), app 22.1.1 build 24941.7

Before 9-Oct-2026 · After 28-Oct-2026

Sign-in to Welcome back is 2.4× faster

Average of 3 before runs (9-Oct) vs average of 4 after runs (28-Oct), same screens

8.2 s	**13.5 s**	**8.4 s**	**4.4 s**
before 19.7 s	before 25.6 s	before 20.4 s	before 15.9 s
Activate tap → Welcome back content	**Sum of 6 page times**	**Spinner time on shared flow**	**Longest spinner**

- **Sign-in loader 7.5 s → 2.5 s.** The fdo.myvzw.com v/auth call took 3.9-4.9 s on HTTP/1.1 and 1.07-1.32 s on HTTP/2.
- **Wait for Welcome back skeleton 8.4 s → 2.7 s.** getAuthorizationCode and meLanding now follow Face ID with no idle gap.
- **Welcome back batch 3.7 s → 2.2 s.** On HTTP/1.1, www.verizon.com used 5 connections and 3 calls queued 1.5-2.0 s. On HTTP/2, all 9 calls share 1 connection and start together (1.7-2.8 s across 4 runs).
- **Same app build in all 7 runs.** 22.1.1 (24941.7), same iPhone, same iOS. The visible change is the protocol (HTTP/1.1 → HTTP/2) and faster backend calls.

Scope and data sources

What is measured and how

Item	Before: 3 runs on 9-Oct	After: 4 runs on 28-Oct
Runs	20:47, 21:11, 23:08	22:27, 23:23, 23:24, 23:27
App / device	22.1.1 (24941.7), iPhone18,1, iOS 26.6.1	Same
Flow compared	Launch → Choose your profile → Activate → Face ID → Welcome back	Same
Network source	Proxyman for 20:47 and 21:11 (all HTTP/1.1). App log for 23:08	Proxyman, all decrypted traffic HTTP/2
Page times	Video frames every 0.5 s, averaged over 3 runs	Video frames every 0.5 s, averaged over 4 runs

- **Page time** is measured from the tap or event that opens a screen until it is fully shown. Time the user spends reading a screen is excluded.
- **Before = average of 3 runs, after = average of 4 runs.** These are all the captures that cover launch to Welcome back. The other 9 cover other flows (next slide).
- **Protocol is as seen through Proxyman.** It is the protocol the app negotiated with the proxy. Different days can also differ in backend load.

All captures checked

16 Proxyman sessions. 7 cover launch → Welcome back

Capture	Flow	Requests	Used
9-Oct 20:47	Launch → profile → activate → Face ID → Welcome back	115, all HTTP/1.1	Before
9-Oct 21:11	Launch → profile → activate → Face ID → Welcome back	98, all HTTP/1.1	Before
9-Oct 23:08	Launch → Welcome back, then Shop and Checkout	0 decoded, 68 in app log	Before
20-Oct 16:41	No screens detected	9	No
20-Oct 17:01	Verizon Dollars and rewards	327	No
20-Oct 17:15	Offers (Grubhub, Live events)	820	No
20-Oct 17:35	Starts on Welcome back, bill pages	874	No
20-Oct 18:51	Mobile and device pages	1057	No
20-Oct 21:55	Launch while signed in, devices and plans	168	No
20-Oct 22:02	Starts on Welcome back, bill history	347	No
20-Oct 22:06	Account and support pages	200	No
20-Oct 22:42	Starts on Welcome back, Shop	743	No
28-Oct 22:27	Launch → profile → activate → Face ID → Welcome back	97 (83 HTTP/2)	After
28-Oct 23:23	Launch → profile → activate → Face ID → Welcome back	100 (84 HTTP/2)	After
28-Oct 23:24	Same. Recording starts just after the icon tap	94 (78 HTTP/2)	After
28-Oct 23:27	Launch → profile → activate → Face ID → Welcome back	99 (78 HTTP/2)	After

Page times per run

Seconds. Before = 3 runs on 9-Oct, after = 4 runs on 28-Oct

Screen	9-Oct 20:47	9-Oct 21:11	9-Oct 23:08	Before avg	28-Oct 22:27	28-Oct 23:23	28-Oct 23:24	28-Oct 23:27	After avg	Change
Choose your profile	4.2	5.0	2.7	4.0	1.9	2.9	2.6	4.1	2.9	-1.1
Activate this device	1.9	2.3	1.5	1.9	2.5	2.4	2.3	2.6	2.4	+0.5
Sign-in loader	7.3	6.2	9.0	7.5	2.0	2.4	2.8	2.7	2.5	-5.0
Face ID	1.0	1.0	1.0	1.0	1.0	1.0	1.5	1.0	1.1	+0.1
Welcome back (skeleton)	7.6	8.1	9.7	8.4	2.6	3.0	2.5	2.5	2.7	-5.8
Welcome back (content)	3.1	2.5	2.5	2.7	1.5	2.5	1.5	2.0	1.9	-0.8
Sum of page times	25.1	25.2	26.4	25.6	11.5	14.2	13.2	15.0	13.5	-12.1
Activate tap → content	19.0	17.9	22.2	19.7	7.1	8.9	8.4	8.4	8.2	-11.5

Activate this device is 0.5 s slower. It waits on launchapp/authentication #2, which now returns 76 KB. Face ID is user and sensor time (1.0-1.5 s), not app time.

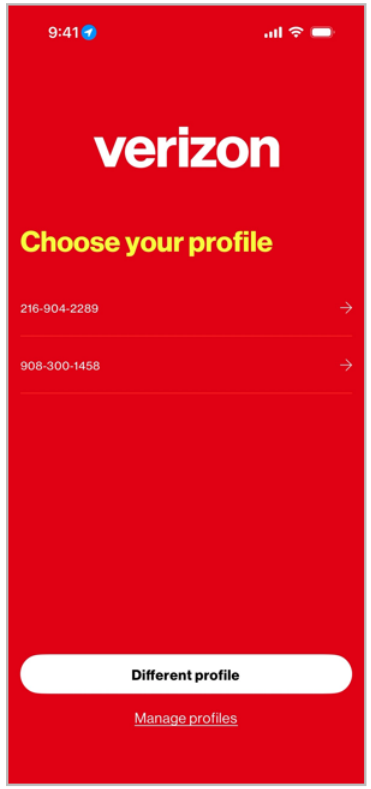

Same screens, before and after (1/2)

Page time = average of 3 before runs and 4 after runs. Screenshots from the 23:08 and 22:27 runs

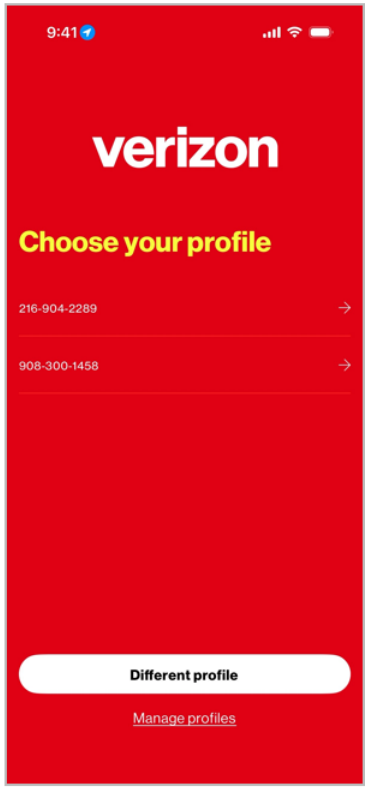

Choose your profile

App icon tap → screen shown

Before: avg of 3 runs
Page time 4.0 s
range 2.7-5.0 s

After: avg of 4 runs

After: avg of 4 runs
Page time 2.4 s
range 2.3-2.6 s

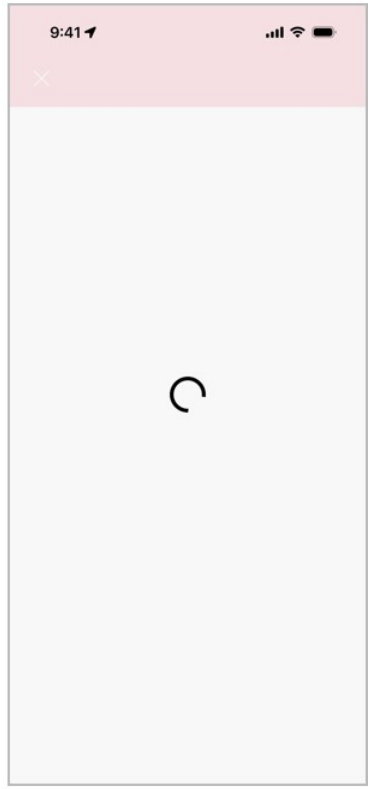

Sign-in loader

Activate tap → Face ID prompt

Before: avg of 3 runs
Page time 7.5 s
range 6.2-9.0 s

After: avg of 4 runs
Page time 2.5 s
range 2.0-2.8 s

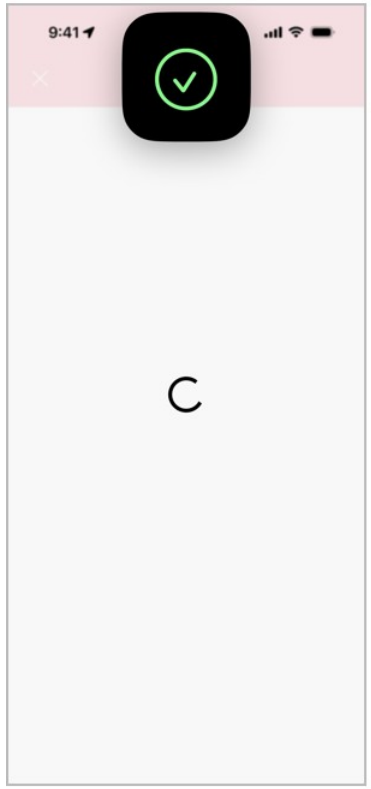

Same screens, before and after (2/2)

Page time = average of 3 before runs and 4 after runs. Screenshots from the 23:08 and 22:27 runs

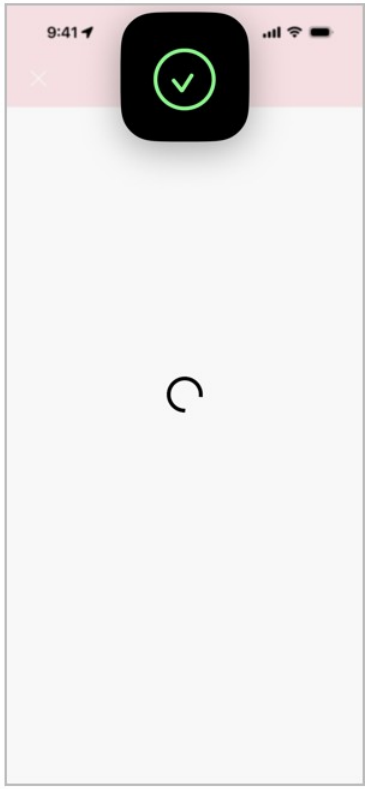

Face ID

Face ID prompt → confirmed

Before: avg of 3 runs
Page time 1.0 s
range 1.0-1.0 s

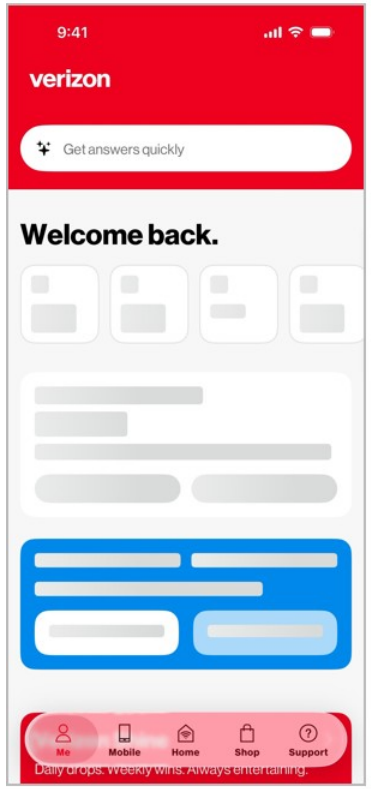

After: avg of 4 runs
Page time 1.1 s
range 1.0-1.5 s

Welcome back (skeleton)

Face ID done → skeleton shown

Before: avg of 3 runs
Page time 8.4 s
range 7.6-9.7 s

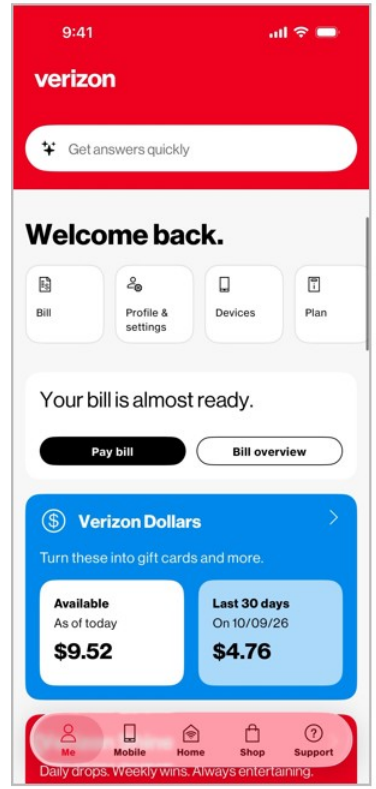

After: avg of 4 runs
Page time 2.7 s
range 2.5-3.0 s

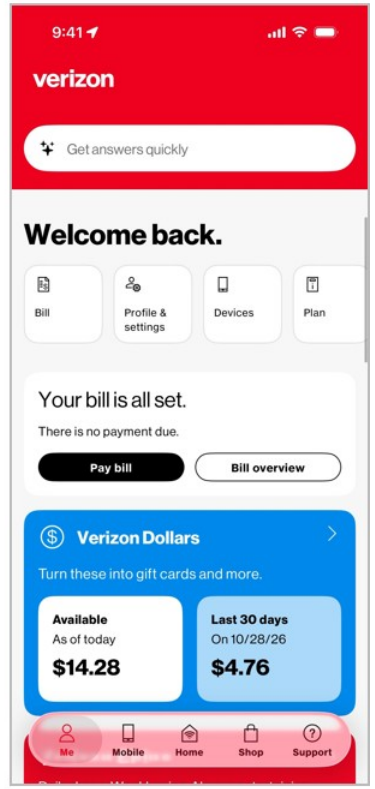

Welcome back (content)

Skeleton → content shown

Before: avg of 3 runs
Page time 2.7 s
range 2.5-3.1 s

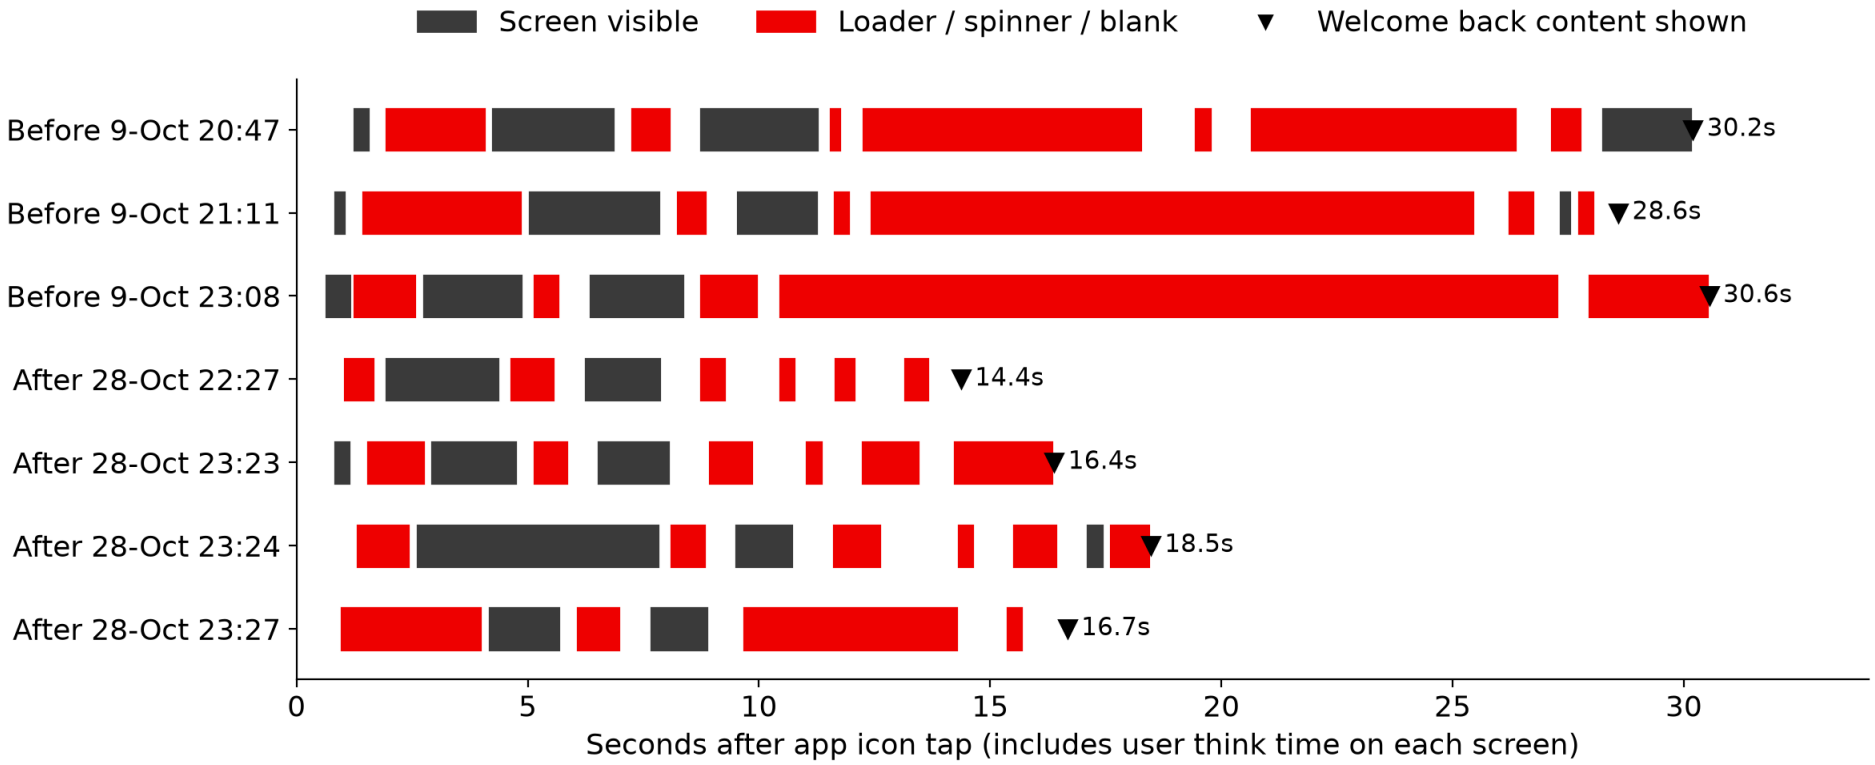

After: avg of 4 runs
Page time 1.9 s
range 1.5-2.5 s

Journey timeline, all 7 runs

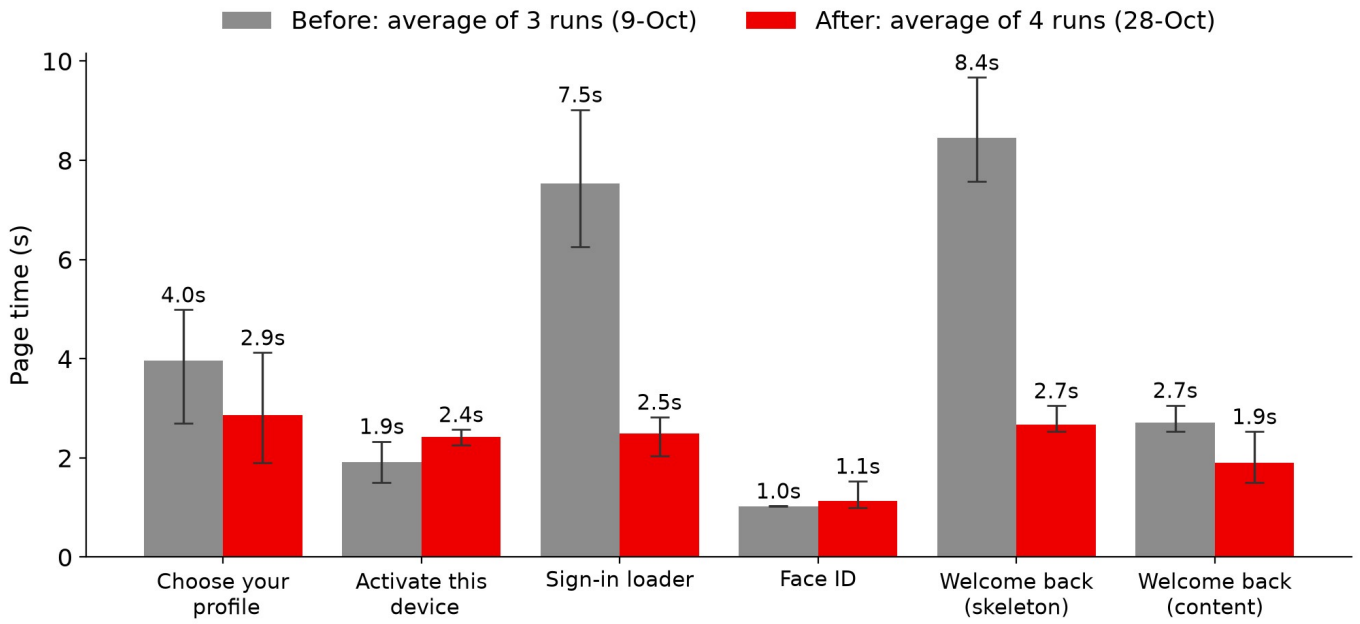

Screens and loaders aligned to the app icon tap

- **Before:** one 14-17 s loader covers sign-in in every run. Content shows at 28.6-30.6 s.
- **After:** loaders of 5 s or less. Content shows at 14.4-18.5 s, including user time on each screen.

Page time per screen, before and after

Average of 3 before and 4 after runs, whiskers show min-max

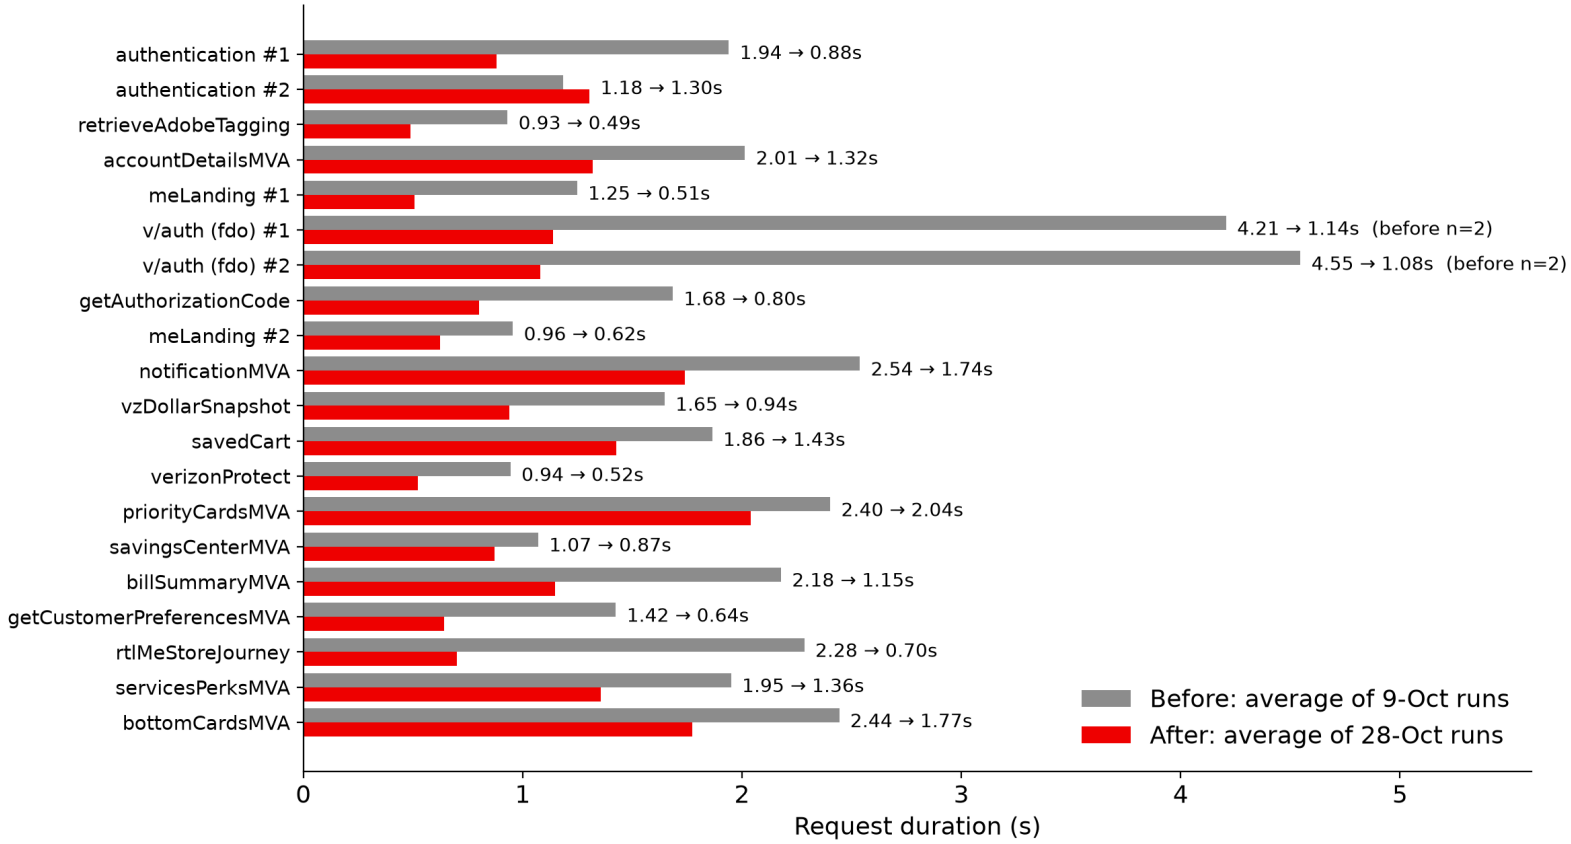

Metric	Before avg	After
Sum of page times	25.6 s	13.5 s
Activate → content	19.7 s	8.2 s
Spinner total	20.4 s	8.4 s
Longest spinner	15.9 s	4.4 s
API p50 (Proxyman)	1.45 s	1.03 s
www.verizon.com conns	5	1

Before API p50 and connections come from the 2 runs with Proxyman data. After values average all 4 runs.

Every shared endpoint, before and after

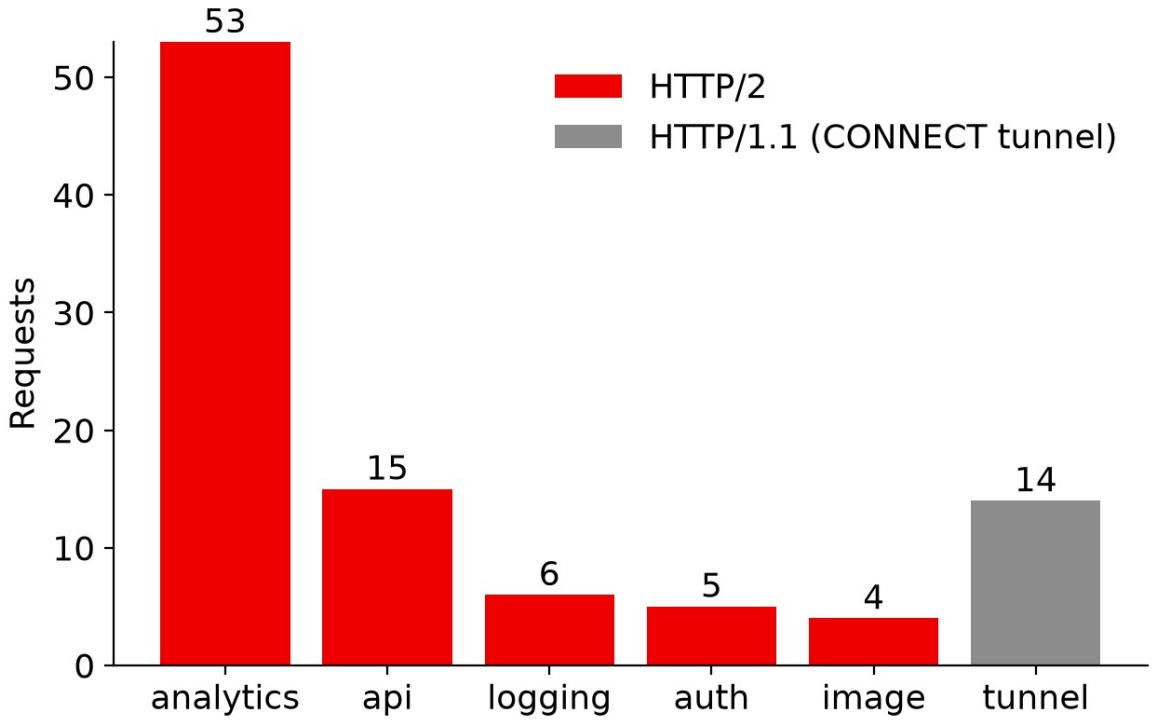

Median 1.90 s → 1.01 s. Total call time 39.5 s → 21.3 s

- **Averages:** 3 before runs vs 4 after runs.
- **Largest drops:** fdo v/auth 4.2-4.6 → 1.1 s, authentication #1 1.94 → 0.88 s, getAuthorizationCode 1.68 → 0.80 s, rtlMeStoreJourney 2.28 → 0.70 s.
- **Smaller change:** priorityCardsMVA 2.40 → 2.04 s and bottomCardsMVA 2.44 → 1.77 s. These now set the Welcome back time.
- **One regression:** launchapp/authentication #2, 1.18 → 1.30 s. Its response is 76 KB.
- **before n=2:** fdo.myvzw.com is not in the 23:08 app log.

HTTP/2 carries all decrypted app traffic

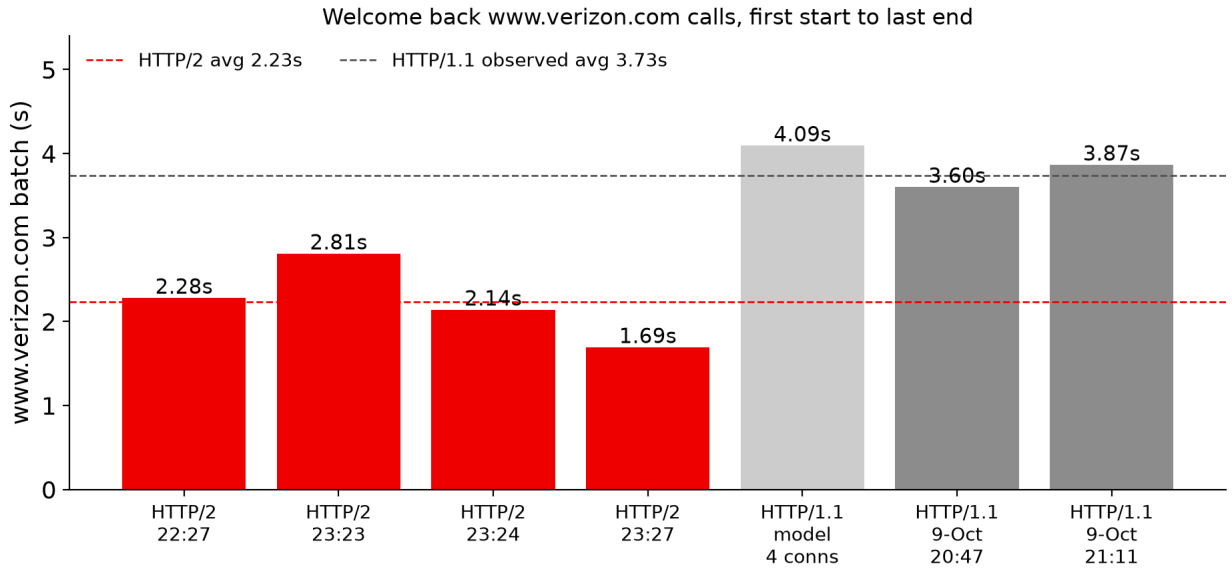

28-Oct capture, 97 requests across 18 hosts

- **83 requests on HTTP/2.** All API, sign-in, image, logging and analytics calls.
- **14 HTTP/1.1 entries are CONNECT tunnels.** Hosts not decrypted by Proxyman (Apple, Quantum Metric ingest, Adobe edge/demdex, rdd.vzw.com, app-analytics-services.com). Their inner protocol is not visible.
- **Few connections for many requests.** 12 new connections served the 83 HTTP/2 requests, about 7 requests per connection.
- **www.verizon.com:** 10 calls on 1 connection. mobile-exp.vzw.com: 14 calls on 2 connections.

How HTTP/2 helps on Welcome back

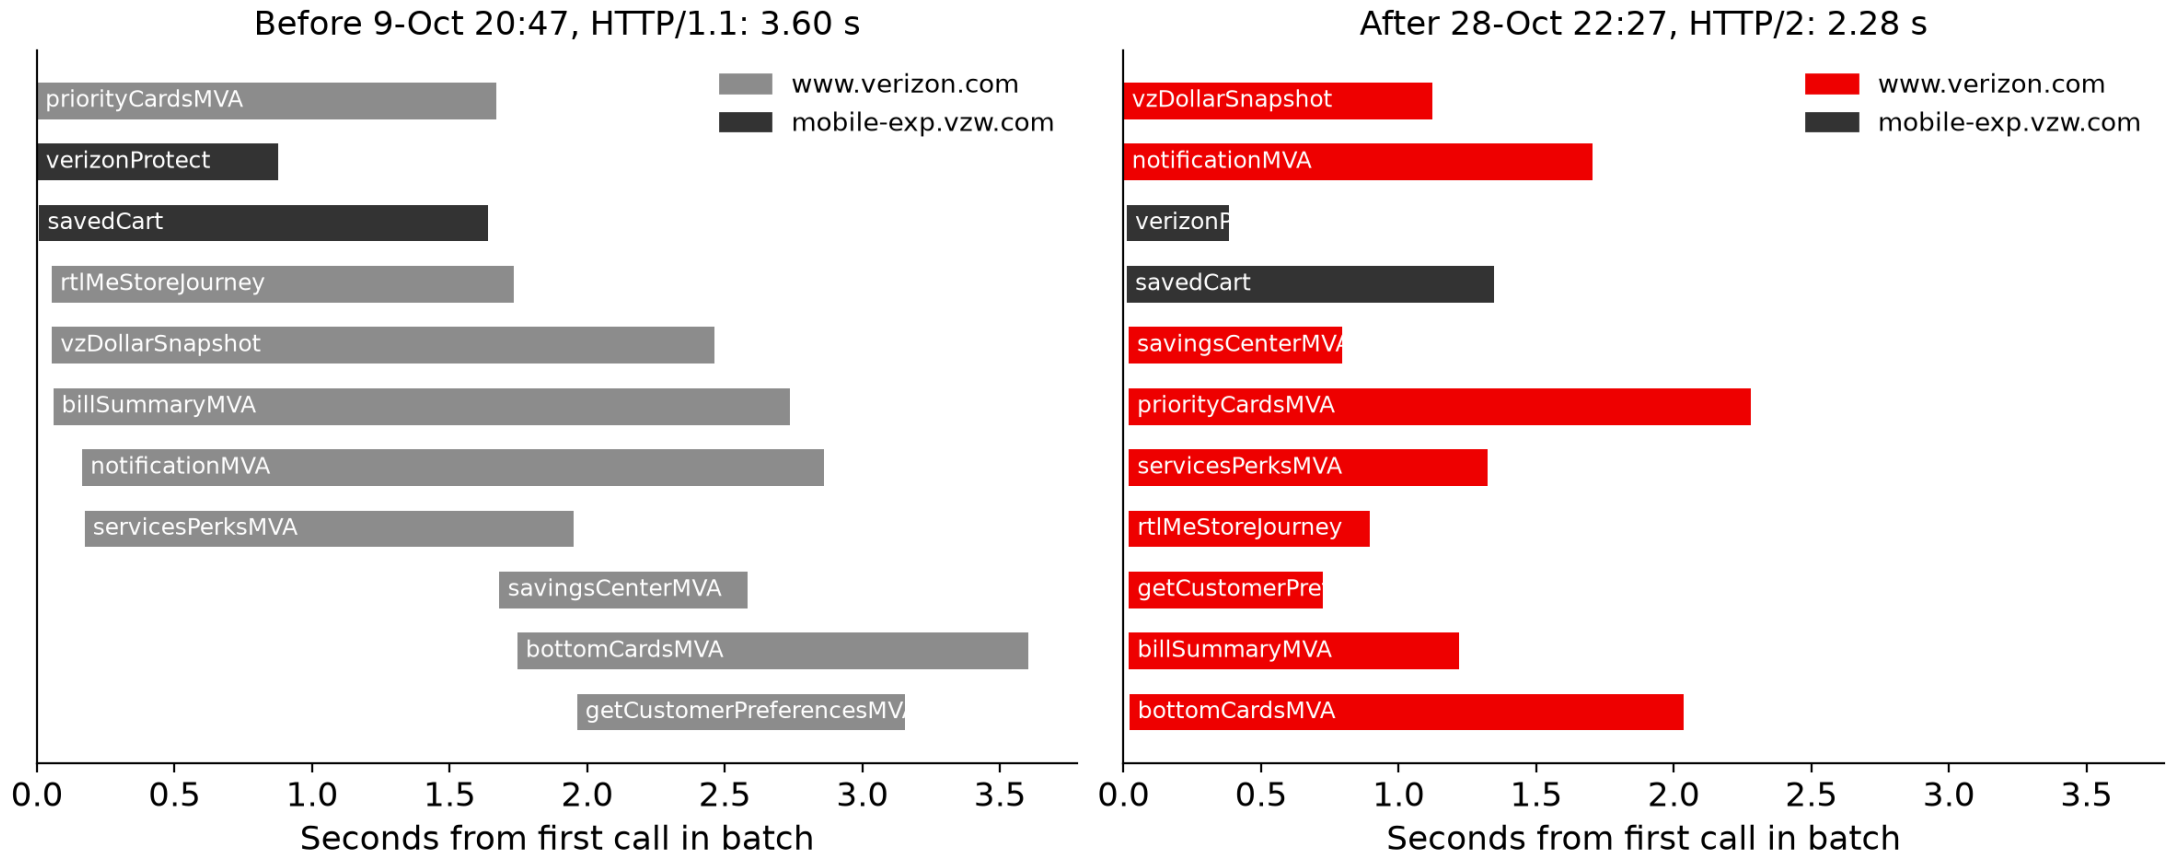

9 parallel www.verizon.com calls: 2 HTTP/1.1 runs vs 4 HTTP/2 runs

- **HTTP/1.1, observed on 9-Oct:** 5 connections to www.verizon.com. 3 of 9 calls wait 1.5-2.0 s for a free connection. Batch 3.60 s and 3.87 s.
- **HTTP/2, observed on 28-Oct:** 1 connection in all 4 runs. All 9 calls start within 20 ms as parallel streams. Batch 1.69-2.81 s, avg 2.23 s, equal to the slowest call.
- **HTTP/1.1 model on 28-Oct 22:27 call times:** 4.09 s with 4 connections. Multiplexing alone saves about 1.8 s.
- **One connection, one handshake.** Fewer TLS setups and compressed headers also help the 53 small analytics beacons.

Welcome back data batch, HTTP/1.1 vs HTTP/2

Bars start when each call starts

On HTTP/1.1, savingsCenterMVA, bottomCardsMVA and getCustomerPreferencesMVA start late. On HTTP/2 every call starts at once (same in all 4 after runs).

Asset inventory: all 18 hosts

28-Oct capture

Host	Reqs	Type	Protocol	Conns	Received	p50	p95
verizontelecom.sc.omtrdc.net	26	analytics 26	h2 26	1	7.6 KB	0.05s	0.20s

app-analytics-services.com	1	tunnel 1	tunnel	-	0.0 KB	0.00s	0.00s

Assets by type

What the app downloads and sends

Type	Requests	Received	Sent	Notes
api	15	136.0 KB	3.4 KB	15 calls on www.verizon.com and mobile-exp.vzw.com
auth	5	114.4 KB	14.4 KB	launchapp/authentication, v/auth, getAuthorizationCode
analytics	53	22.1 KB	146.9 KB	Adobe, Quantum Metric, Firebase, New Relic
logging	6	0.7 KB	0.7 KB	logger/logStat on mobile-exp.vzw.com
image	4	0.0 KB	0.0 KB	assets.verizon.com, ss7.vzw.com. 3 of 4 are 304
tunnel	14	0.0 KB	0.0 KB	Not decrypted, size unknown

- **Analytics is 55% of all requests** (53 of 97) but under 10% of the bytes.
- **Two responses carry most of the data.** launchapp/authentication 76 KB and launchapp/meLanding 73 KB.
- **Images are small and mostly cached.** They are not a bottleneck on these screens.

Analytics and third-party cost

Traffic that is not needed to draw the screen

Vendor	Requests	During spinner	Received	Sent
Adobe Analytics / Launch	52	26	7.6 KB	47.3 KB
Quantum Metric	8	5	14.5 KB	0.0 KB
First-party telemetry (logger/logStat)	6	3	0.7 KB	0.7 KB
Apple	2	0	0.0 KB	0.0 KB
Undecrypted (rdd.vzw.com)	2	0	0.0 KB	0.0 KB
New Relic	1	0	0.0 KB	1.6 KB
Google Firebase	1	0	0.0 KB	98.0 KB
Google Analytics	1	0	0.0 KB	0.0 KB

- **34 analytics calls fire while a spinner is on screen.** They compete with sign-in calls for the network and CPU.
- **Firebase batch upload is 98 KB.** It waited up to 0.67 s on the device before sending.
- **Adobe Launch rules file** is checked 23 times in 14 s though it is cached for one hour.

Caching and payload findings

Cheap fixes on the server and client side

Item	Observed	Fix
Adobe launch-…-rules.zip	23 revalidations (304) in 14 s, max-age 3600	Reuse cached copy until max-age expires
verizon/rockettes image	3 revalidations in 1 s, no max-age	Send Cache-Control: max-age
launchapp/authentication #2	76 KB. navigationPatterns 12.9 KB, requestCookies 8.3 KB	Trim or cache static maps
launchapp/meLanding	73 KB. molecules 34.7 KB, actions 22.3 KB	Split above-the-fold data from the rest
Duplicated blocks	noConnectionPage 3.5 KB sent twice, ShoppingConfig 3.0 KB	Send once per session
fdo.myvzw.com	2 sign-in calls, about 1.07 s each, no CDN	Front with CDN or keep connection warm

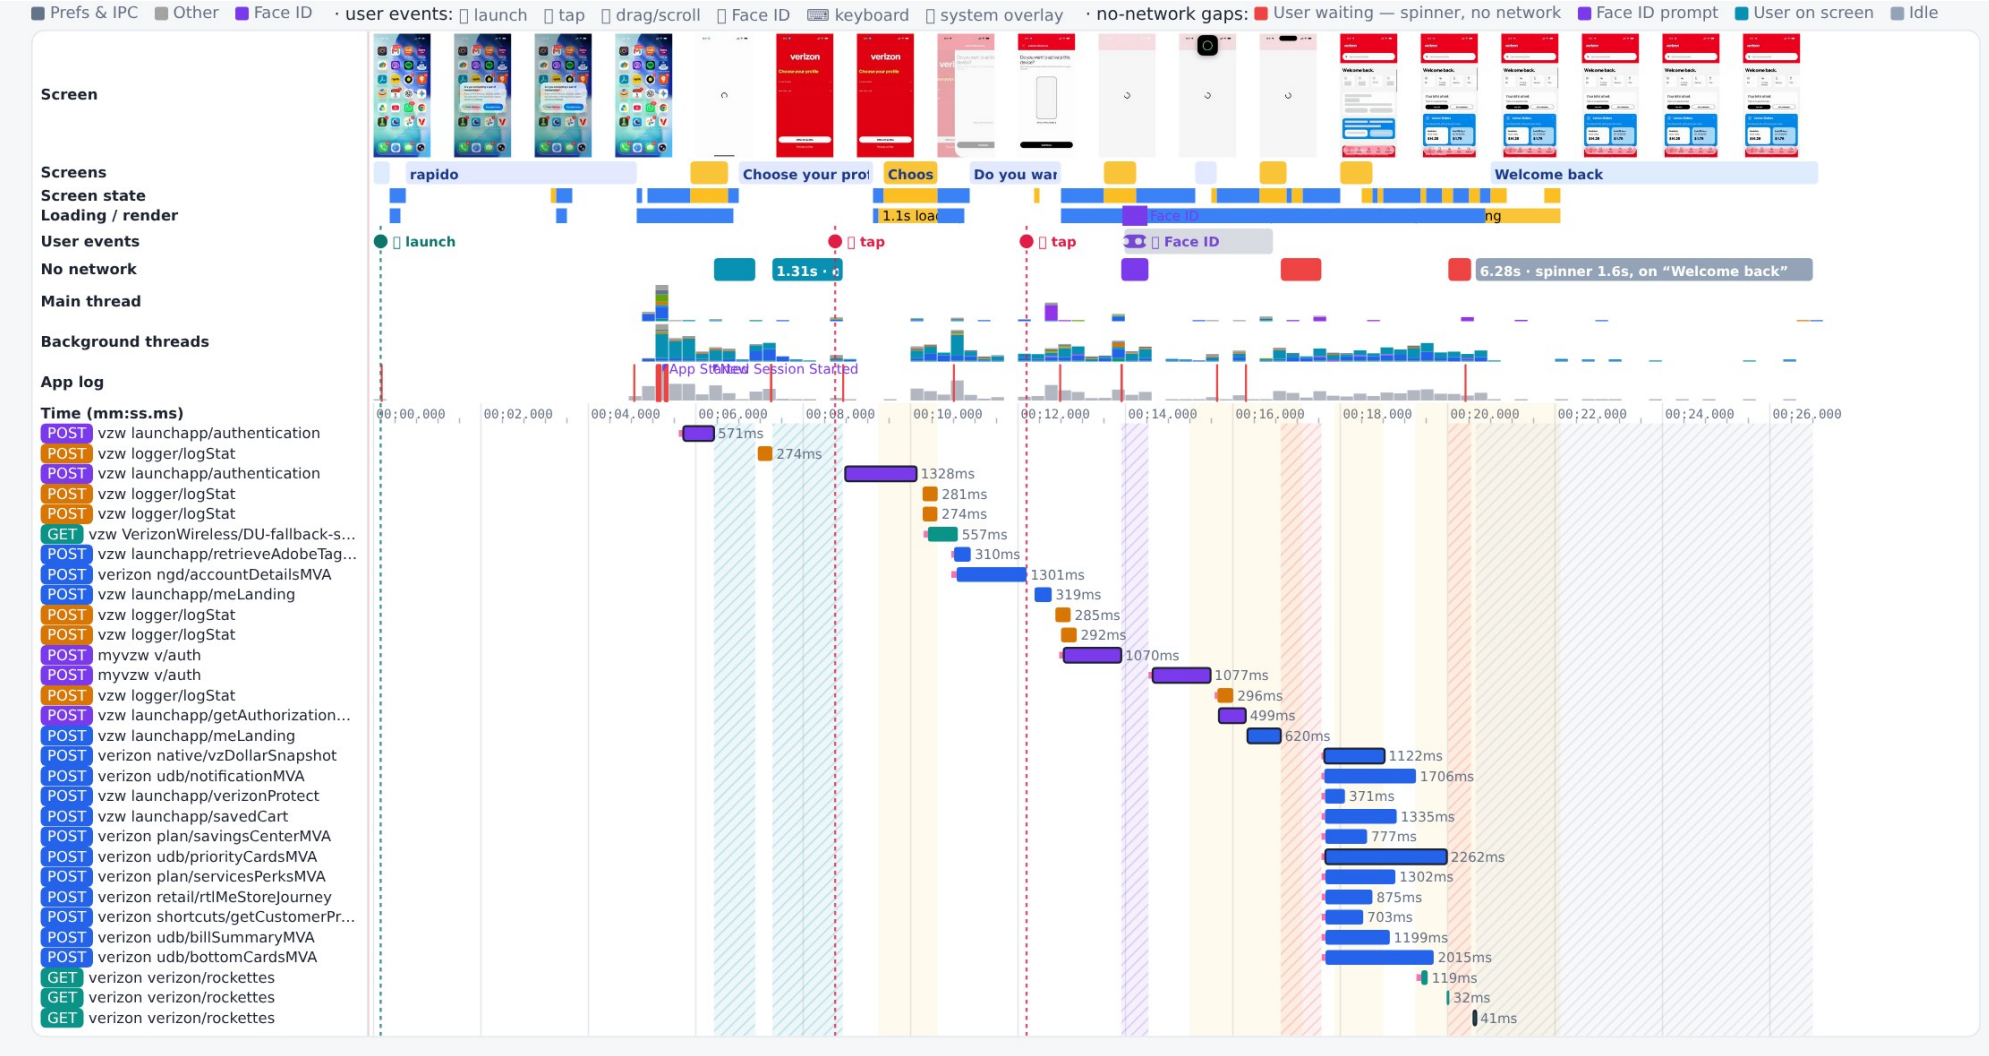

Client-side findings

Time spent on the device, not on the network

- **Gaps with no request in flight.** 0.78 s and 0.76 s on the critical path, plus 0.76 s of spinner with no network work.
- **10 synchronous calls on the main thread** (badge number). These block UI updates.
- **Face ID availability checked 12 times in 0.51 s.** One check is enough.
- **Slow tap feedback.** 2 of 2 taps showed a pressed state after more than 150 ms. Worst 657 ms on Choose your profile.
- **One 217 ms frame hitch** during the launch animation.
- **Launch → first API call 5.55 s** in the report includes the springboard. From app process start it is about 0.8 s.

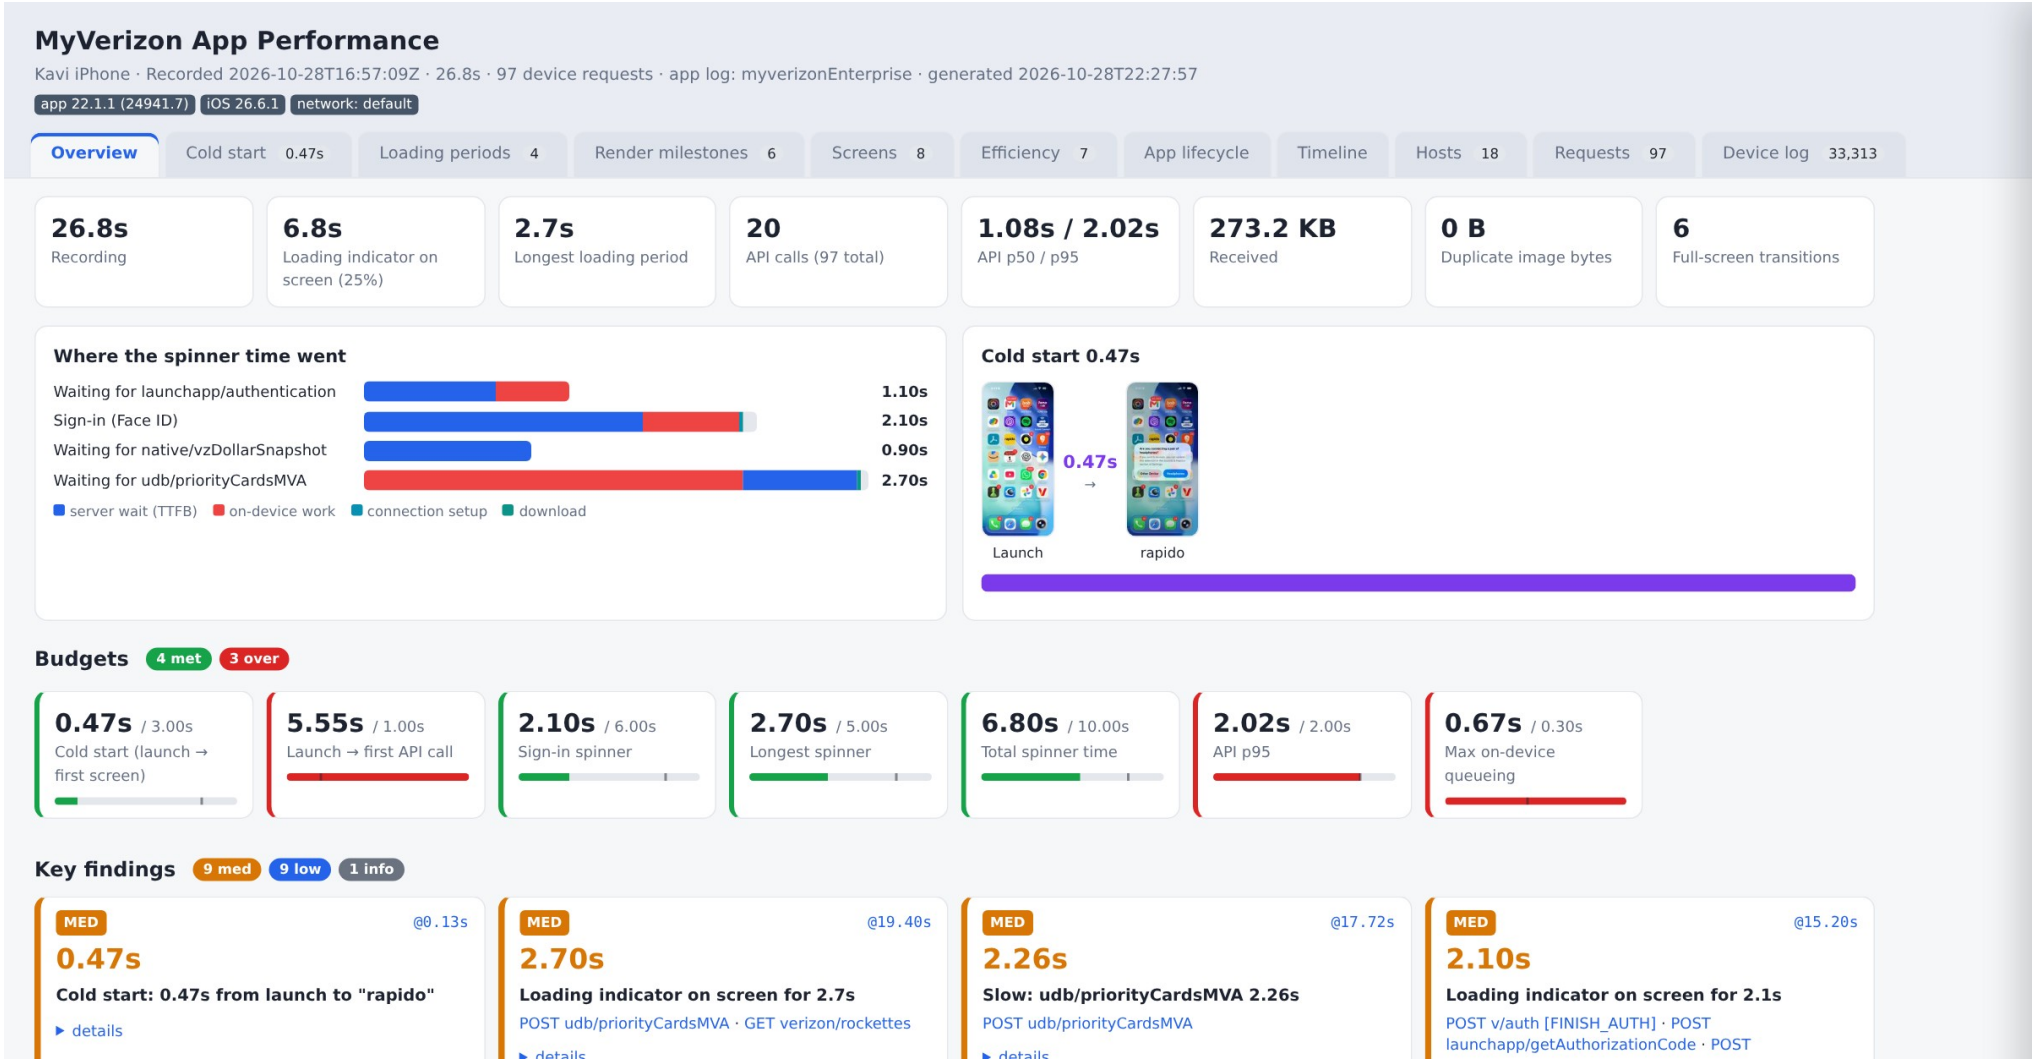

Report view: after (28-Oct) request timeline

Proxyman report, Timeline tab

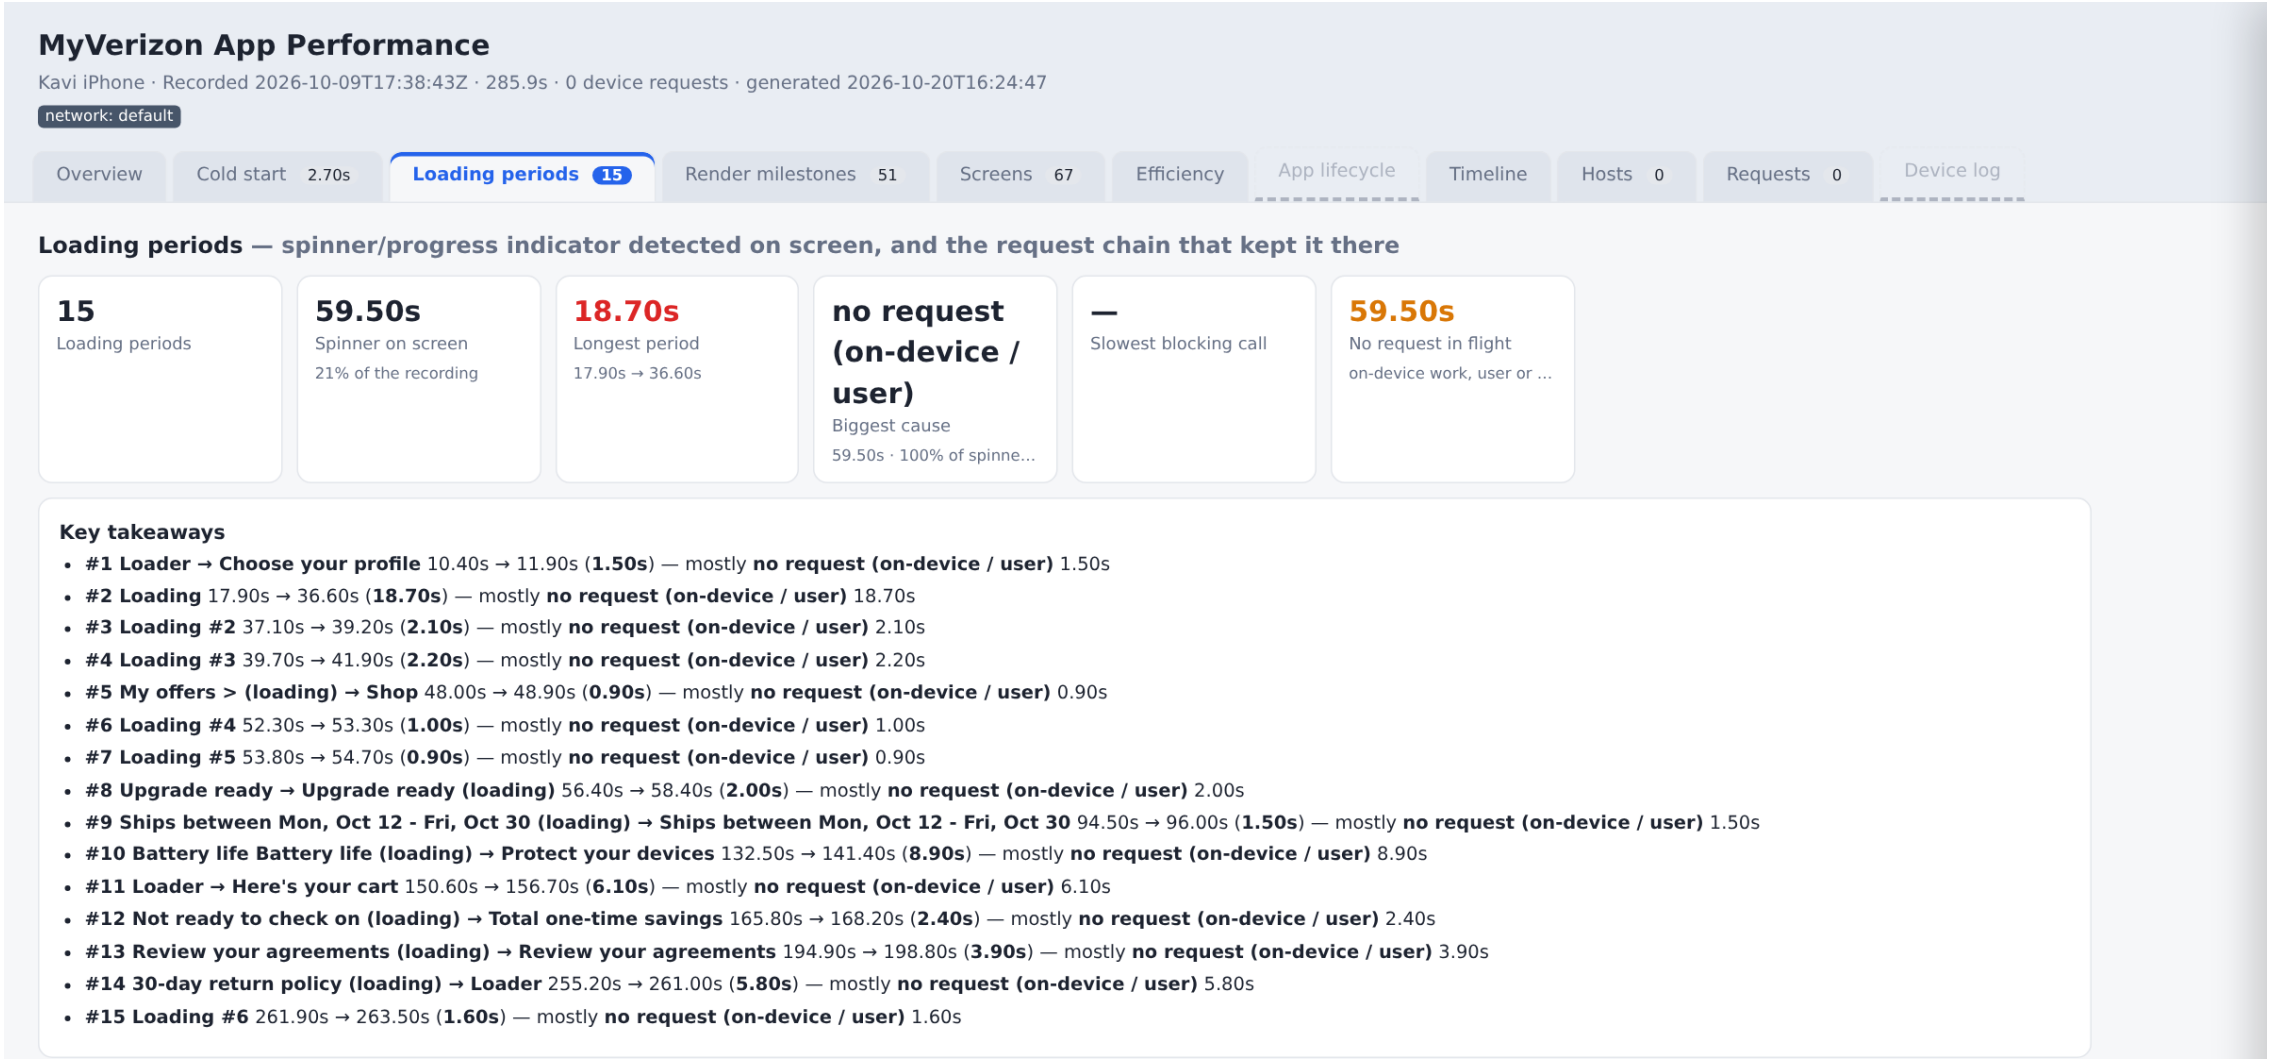

Report view: after (28-Oct) overview

Proxyman report, Overview tab

Report view: before (9-Oct 23:08) loading periods

One of the 3 before runs. The 18.7 s loader is the main cost

Next improvements

Ranked by expected time saved on Welcome back

#	Action	Expected gain	Owner
1	Cut on-device gaps between sign-in calls (prefetch, start next call on response)	up to 2.6 s	App
2	Speed up udb/priorityCardsMVA and bottomCardsMVA on www.verizon.com	up to 1.9 s	API
3	Defer analytics and Firebase upload until the spinner clears	0.5-0.9 s	App
4	Trim launchapp/authentication and meLanding payloads	0.2-0.4 s	API
5	Honour max-age for Adobe rules and add max-age to images	fewer requests	App / CDN
6	Move badge calls off the main thread, single Face ID check	smoother UI	App
7	Keep HTTP/2 on all hosts and coalesce hosts where possible	fewer handshakes	Platform

Gains 1 and 2 come from the report savings estimate. They overlap, so they do not add up exactly.
